Product Overview

Mini-Circuits' RUDAT-6000-30 is a general purpose, single channel programmable attenuator suitable for a wide range of signal level control applications from 1 MHz to 6 GHz. The Attenuator provides 0 to 30 dB attenuation in 0.25 dB steps. Its unique design maintains linear attenuation change per dB, even at the highest attenuation settings.

The attenuator is housed in a compact and rugged package with SMA female connectors on the bi-directional input and output RF ports, a standard 9 pin D-Sub and a USB type Mini-B power and control ports.

The attenuator can be controlled via USB or RS232 (via D-Sub connector). Full software support is provided and can be downloaded from our website any time at <http://www.minicircuits.com/softwaredownload/patt.html>. The package includes our user-friendly GUI application for Windows® and a full API with programming instructions for Windows® and Linux® environments (both 32-bit and 64-bit systems).

Key Features

¹ Attenuator RF ports are interchangeable, and support simultaneous, bidirectional signal transmission, however the specifications are guaranteed for the RF in and RF out as noted on the label. There may be minor changes in performance when injecting signals to the RF Out port.

² Max accuracy defined as ±[absolute error+% of attenuation setting] for example when setting the attenuator to 18 dB attenuation the maximum error will be: ±(0.95+0.02x18)= ±(0.95+0.36)= ± 1.31 dB.

³ Total operating input power from both RF In and RF Out out ports. Compression level not noted as it exceeds max safe operating power level.

⁴ Isolation is defined as max attenuation plus insertion loss; this is the path loss through the attenuator when initially powered up. After a brief delay (~0.5 sec typically) the attenuator will revert to a user defined "power-up" state (either max attenuation or a pre-set value).

⁵ Tested with 1 MHz span between signals.

⁶ Minimum Dwell Time is the time the RUDAT will take to respond to a command to change attenuation states without communication delays. In PC control add communication delays (on the order of msec for USB) to get actual response time.

⁷ Attenuation Transition Time is specified as the time between starting to change the attenuation state and settling on the requested attenuation state.

⁸ Supply voltage +5V at Pin#1 of D-sub connector applies to units with S/N 11405010010 and greater.

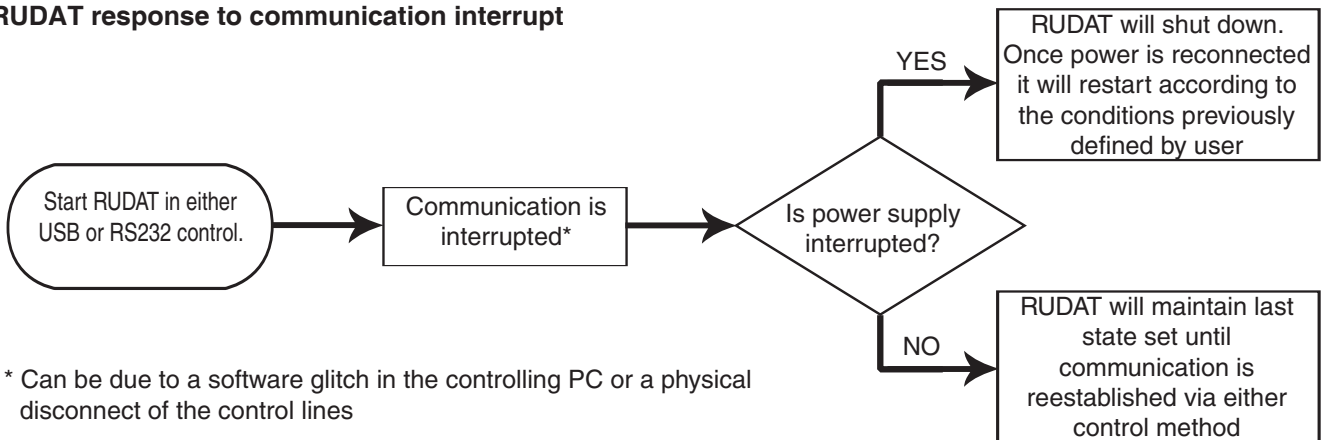

⁹ Power on sequence for RS232 control: Connect 5V power followed by the control lines.

Absolute Maximum Ratings

Operating Temperature	0°C to 50°C	
Storage Temperature	-20°C to 85°C	
Voltage input at RS232 receive pin	-30V to +30V	
Voltage input at RS232 transmit pin	0V to +4V	
Voltage input at RS232 Pin#1	-1V to +6V	
V _{USB} Max.	6V	
DC voltage at RF port	16V	
Total RF power for	@ 1 to 10 MHz	+13 dBm
RF In & RF Out	@ 10 to 6000 MHz	+23 dBm

Permanent damage may occur if any of these limits are exceeded. Operation in the range between the max operating power and the absolute maximum rating for extended periods of time may result in reduced life and reliability.
