Product Overview

Mini-Circuits' USB-1SP16T-83H is a high isolation (90 dB typical), absorptive SP16T switch with USB and LVTTL control. The fast switching, solid state switch operates from 1 MHz to 8000 MHz with 5 µs typical switch transition speed and high linearity (+50 dBm typ IP3) which allow the model to be used for a wide variety of RF applications.

Full software support is provided for USB control, including our user-friendly GUI application for Windows and a full API with programming instructions for Windows and Linux environments (both 32-bit and 64-bit systems). The latest version of the full software package can be downloaded from https://www.minicircuits.com/softwaredownload/solidstate.html at any time.

The USB-1SP16T-83H is housed in a low profile, rugged metal case (10.98" x 2.50" x 0.6") with 17 SMA (F) connectors (COM, and J1 to J16), a USB Mini-B port and a D-Sub 9 pin port for power and two data bus connectors for Master / Slave connections to other modules.

[1] Compression and IP3 may degrade below 10 MHz.
[2] IP3 Tested with 1 MHz span between signals, +5 dBm per tone.
[3] Switching time spec represents the time that the RF signal paths are interrupted during switching and thus is specified without communication delays.
[4] Transition time spec represents the time that the RF signal paths are interrupted during switching and thus is specified without communication delays.
[5] Minimum dwell time is the shortest time that can be achieved between 2 switch transitions when programming an automated switch sequence.
[6] Switching time(USB) is the time from issuing a single software command via USB to the switch state changing. The most significant factor is the host PC, influenced by CPU load and USB protocol. The time shown is an estimate for a medium CPU load and USB 2.0 connection.
[7] Switching time(LVTTL) is the time from setting the control at he LVTTL input to the desired logic state, to the RF signal at the specified output reaching 90% of the steady state.
[8] Current consumption specified for a single unit without any slave modules.
[9] Pass through current is the maximum current handling of a unit with slave modules attached. If controlling a large number of slave modules additional power supplies should be included to ensure this limit is not exceeded. See page 5 for details.

The USB-1SP16T-83H LVTTL control interface consists of 5 unlatched parallel control bits that select the desired switch state, as shown in the truth table below. The parallel control does not have any latch and thus will respond immediately to any change.

Connecting the switch to USB control and establishing USB communication will disable the LVTTL control until the switch is reset by disconnecting and then reconnecting power.

All LVTTL controls are connected with internal pull-down resistors so the default state of the switch is disconnected state.

Power can be provided via either the D-Sub port or USB port, regardless of the control method used.

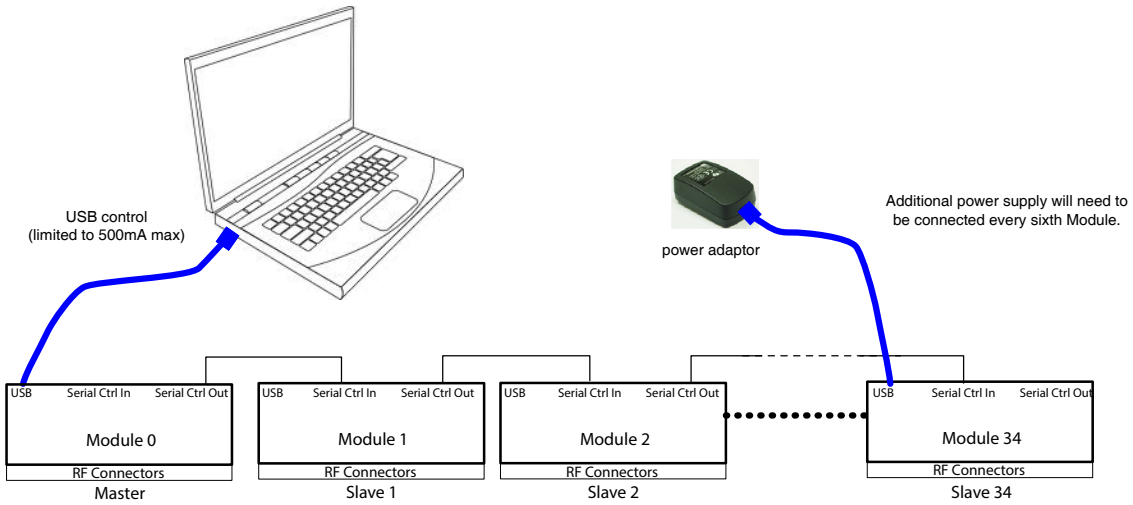
All inactive ports will be internally terminated to 50 Ω.
In disconnected state, all ports including COM port will be terminated internally.
Note maximum input power to internal termination listed on page 2 & 3.

Connecting multiple modules (Daisy Chain)

The USB-1SP16T-83H is designed to connect up to 35 modules in series (Daisy chain) using dynamic addressing, meaning there is no need to specifically set the address of the modules, the addresses will be set automatically as part of establishing the communications with the PC. The module connected to the PC USB port will be assigned address 0 (Master), the first module connected to it will get address 1(slave) and subsequent modules incrementing up to address 34 (slave).



Connections between modules will be made using the serial in/out ports with the module connected to the PC as a master and all others as slave modules. All control will be through the master module (address zero) which is the only one communicating with the PC. Serial control out port of each module should be connected to the serial control in port of the next module. Power will be supplied from the PC via the master module up to a maximum of 500mA.

If connecting USB-1SP16T-83H units in series, additional power supply will generally be needed every six to eight modules. If mixing modules of different types ensure the max current through any unit does not exceed 500mA. All power supplies should be connected to the module via the module's USB port, connecting an additional power supply will automatically cut off power draw from the serial control in port for that module.

The Serial master/slave bus allows connecting modules of different types to the same daisy chain as long as all support Mini-Circuits Dynamic addressing setup. To add a new module to the set up simply connect the module to the setup and refresh the address listing, no need to reset any of the existing modules or assign addresses manually.

Connecting slave units should be done only with control cables provided by Mini-Circuits
