PRODUCT OVERVIEW

Mini-Circuits' XLF-272M+ reflectionless filter employs a novel filter topology which absorbs and terminates stopband signals internally rather than reflecting them back to the source. This new capability enables unique applications for filter circuits beyond the traditional approaches. Traditional filters are reflective in the stopband, sending signals back to the source at 100% of the power level. These reflections interact with neighboring components and often result in intermodulation products and other interferences. Reflectionless filters eliminate stopband reflections, allowing them to be paired with sensitive devices and used in applications that otherwise require circuits such as isolation amplifiers or attenuators.

KEY FEATURES

Features	Advantages
Reflectionless Technology	Reflectionless filters absorb unwanted signals, preventing reflections back to the source. This reduces generation of additional unwanted signals without the need for extra components like attenuators, improving system dynamic range and saving board space.
50Ω Match in Stopband	Reflectionless filters maintain good impedance matching in the stopband, allowing for integration with high gain, wideband amplifiers without the risk of creating out of band instabilities .
Excellent RF Performance Repeatability	Fabricated on a GaAs process, X-series filters are inherently repeaData for large volume production.
Excellent Temperature Stability and Robustness	With ±0.3 dB variation over temperature, the XLF-272M+ is ideal for use in wide temperature range applications without the need for additional temperature compensation. Up to +105°C rating allows for suiData operation close to high power components.
Excellent Power Handling in a Compact Package • Passband +37 dBm at +25°C • Stopdband +29 dBm at +25°C	High power handling extends the usability of these filters to the transmit path for inter-stage filtering. A compact 3x3 mm 12-Lead QFN-style package enables replacement of filter/ attenuator pairs with a single reflectionless filter, saving board space in dense assemblies.
