## PRODUCT OVERVIEW

Mini-Circuits' ZTS-8X8B-18-S is a high performance 8 by 8 blocking switch matrix operating over a wide bandwidth from 100 MHz to 18 GHz. The system is integrated into a compact 19-inch rack-mountable chassis with 8 RF ports (A1 to A8) on the front panel and 8 RF ports (B1 to B8) on the rear, all SMA female.

The blocking configuration supports 8 active switch paths at any time, with each of the 8 "A" ports able to connect to any of the 8 "B" ports in a one-to-one arrangement. The matrix is bi-directional so the "A" and "B" ports can be used interchangeably as both inputs and outputs.

The switch matrix can be controlled via USB or Ethernet (supporting SSH, HTTP and Telnet network protocols). Full software support is provided, including our user-friendly GUI application for Windows and a full API with programming instructions for Windows and Linux environments.

The daisy-chain control interface further simplifies control integration by allowing multiple switch racks to be interconnected via their respective serial in and out connections. The complete set of daisy-chained matrices can then be independently controlled through a single USB / Ethernet connection.

## KEY FEATURES

Feature	Advantages
Blocking	One-to-one switch paths with low loss when connected and high isolation when disconnected; minimizing the impact of the matrix itself on sensitive RF test results.
Solid-state switches	Mini-Circuits' solid-state switches provide high isolation between disconnected ports with fast switching time and exceptional reliability.
Secure Ethernet communication	Support for SSH (Secure Shell protocol) provides a means for secure communication over Ethernet networks with strict security policies. HTTP & Telnet communication via Ethernet are also supported.
Rack-mount chassis	Compact 3U height, 19" rack-mountable chassis suits integration in automated production test environments.
Integrated control & power	Easy to use on the lab bench or integrate into larger automated test systems without the need to develop custom control systems.

1. Isolation from input to output on a disconnected switch path. Example: A1 to B1 isolation is the leakage measured at B1 from a signal input at A1 when the switch in path is disconnected.

2. Isolation between any pair of A ports or between any pair of B ports for any combination of connected switch paths. This parameter is influenced by the isolation of the switch opposite.

3. Return loss in all switch path states
