### THE BIG DEAL

- Exceptionally High Frequency
- Flat Gain Response, ±2.0 dB Typ.
- Low Noise Figure, 2.7 dB Typ.
- High P<sub>SAT</sub>, +20 dBm Typ.
- Wide DC Operating Voltage, +10 To +15 V
- Over Voltage And Reverse Voltage Protected

### APPLICATIONS

- 5G-FR2 Millimeter Wave Testing
- Aerospace & Defense
- Test and Measurement
- Q-band, V-band SATCOM
- Wireless Infrastructure
- IEEE 802.11.ad WiGig

### PRODUCT OVERVIEW

Mini-Circuits' ZVA-44703LN+ is a coaxial wideband and low noise amplifier operating from 44 GHz to 70 GHz. The model operates over a positive supply range of +10 to +15 V, allowing users to choose their desired operating voltage. Internal DC-DC conversion circuitry maintains constant efficiency over the full input voltage range. The amplifier incorporates several DC-protection features such as over-voltage, reverse voltage, and in-rush current protection to protect from damage in case of unexpected spikes in voltage during operation. The high frequency operation combined with high gain and low noise figure makes this amplifier an ideal choice for SATCOM applications and 5G testing in millimeter wave bands.

### KEY FEATURES

Features	Advantages
Wideband Amplifier, 44 to 70 GHz	A single broadband covers 5G millimeter wave bands as well as Q-Band and V-Band SATCOM receiver applications with critical noise figure requirements.
Low Noise, 2.7 dB Typ. High P <sub>SAT</sub> , +20 dBm Typ.	Exceptionally low noise figure and medium output power at extremely high frequencies enables minimal system signal to noise degradation while providing high signal drive power for over-the-air and bench top test applications.
Wide DC Operating Voltage, +10 To +15 V	The device can operate from +10 to +15 V, maintaining constant DC power consumption with no effect on RF performance and facilitating ease of use in test setups with existing established voltage supplies.
DC Protection <ul style="list-style-type: none"> <li>• Over-voltage</li> <li>• Reverse voltage</li> <li>• In-rush current</li> </ul>	The internal DC circuitry allows the amplifier to be protected from external mishandling or unexpected spikes in voltage that could lead to catastrophic failures in the field.
