

THE BIG DEAL

- Cost effective millimeter wave signal source
- High output power up to +17 dBm
- Low phase noise across the full band
- Excellent harmonic rejection, -30 dBc typ
- CW & pulsed outputs with 0.5 us pulse width
- Compact package with automation via USB & Ethernet
- SSH secure Ethernet communication

APPLICATIONS

- 5G FR1 & FR2, WiFi 6E, millimeter wave radio infrastructure
- Semiconductor high power burn-in & life testing
- Wideband LO source
- Benchtop signal generator
- Automated production test systems

PRODUCT OVERVIEW

Mini-Circuits' SSG-44G-RC is a wide-band signal generator operating from 100 MHz to 44 GHz. With up to +14 dBm typical output power at 44 GHz, it is an ideal signal source for characterization of millimeter wave components and systems at high power. Configure CW / single-tone outputs, flexible pulse sequences with pulse widths down to 0.5 μs, or automated frequency / power sweep & hop sequences.

SSG-44G-RC has been developed in a compact package with powerful software control and automation to provide a cost effective millimeter wave signal generator and LO source for any bench or production test application. This is a high quality, repeatable and reliable signal source with low phase noise all the way up to 44 GHz (-105 dBc typ @ 100 kHz offset) and excellent harmonic rejection (-30 dBc typ).

The generator can be controlled via USB or Ethernet (supporting SSH, HTTP & Telnet protocols). Full software support is provided, including our user-friendly GUI application for Windows, flexible API and programming instructions for Windows and Linux environments. The daisy-chain control interface with "dynamic addressing" simplifies control integration and allows multiple units to be combined into a multi-channel signal source with control through a single software interface.

KEY FEATURES

Feature	Advantages
High quality signal source	Outstanding combination of exceptional bandwidth, fine frequency and power resolution, low phase noise and excellent harmonic rejection in a compact package; suited to a wide range of test applications.
Flexible pulse modulation	Configure pulse sequences with varying frequency, power and pulse repetition intervals (PRI).
Sweep & hop sequences	Configure custom CW output frequency and power sequences to run unaided for high speed, automated test applications.
USB & Ethernet control	USB HID and Ethernet (HTTP / Telnet / SSH) interfaces provide easy compatibility with a wide range of software setups and programming environments.
Dynamic daisy-chain control	Simplify control software and interconnections and develop low-cost, multi-channel signal generator systems by daisy-chaining multiple units with control through a single interface.

1. Frequency resolution is tested with 10 MHz external reference.

2. Settling time - transition time between 2 output states. During the transition, RF output is turned off to avoid transient outputs.

3. Generator response time is Dwell time + Settling time.

4. For hop sequences pre-loaded into internal memory (high-speed mode).

5. Dwell time - duration of each signal point in a Sweep or Hop sequence set by user. Default is minimum dwell time.

REGULAR PULSE MODULATION SPECIFICATIONS AT +25°C

Repetitive RF pulse sequences with fixed frequency and power, supporting internal or external modulation and input / output trigger options.

	PWR _{OUT} = +10dBm, FREQ _{OUT} = 44 GHz	-	50	-		

6. Pulse width must be less than pulse period by at least 0.5 μs.

7. Pulse widths below 0.5 μs can be set, however performance is only guaranteed for 0.5 μs and up.

8. Pulse rise time will increase with pulse interval under 3 μs.

9. Pulse width accuracy is 3% of pulse width, or ±100 ns, whichever is greater.

10. For signals at same power & Frequency.

CONTROL INTERFACES

Ethernet Control	Supported Protocols	TCP / IP, HTTP, Telnet, SSH, DHCP, UDP (limited)
	Max Data Rate	100 Mbps (100 Base-T Full Duplex)
USB Control	Supported Protocols	HID (Human Interface Device) - High-speed
	Min Communication Time ¹³	400 μs typ (full transmit/receive cycle)

13. USB Min Communication Time is based on the polling interval of the USB HID protocol (125 μs polling interval, 64 bytes per packet), medium CPU load and no other high-speed USB devices using the USB bus.

SOFTWARE & DOCUMENTATION

Mini-Circuits' full software and support package including user guide, Windows GUI, API, programming manual and examples can be downloaded free of charge (refer to the last page for the download path).

A comprehensive set of software control options is provided:

- GUI for Windows – Simple software interface for control via Ethernet and USB.
- Programming / automation via Ethernet:
 - Complete set of control commands which can be sent via any supported protocol.
 - Simple to implement in the majority of modern programming environments.
- Programming / automation via USB:
 - DLL files provide a full API for Windows with a set of intuitive functions which can be implemented in any programming environment supporting .Net Framework or ActiveX.
 - Direct USB programming is possible in any other environment (not supporting .Net or ActiveX).

Please contact testsolutions@minicircuits.com for support.

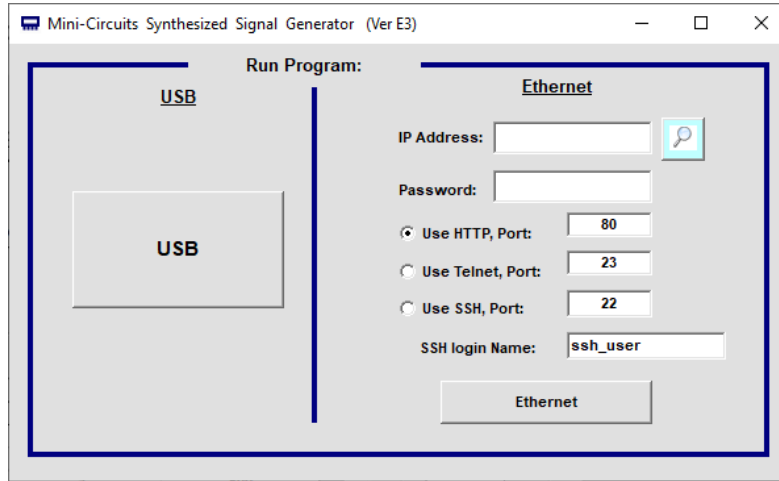

MINIMUM SYSTEM REQUIREMENTS:

GUI	Windows 7 or later
USB API DLL	Windows 7 or later and programming environment with ActiveX or .NET support
USB Direct Programming	Linux, Windows 7 or later
HTTP, Telnet or SSH	Any computer with a network port and Ethernet-TCP/IP (HTTP, Telnet or SSH protocols) support
Hardware	Intel i3 (or equivalent) or later

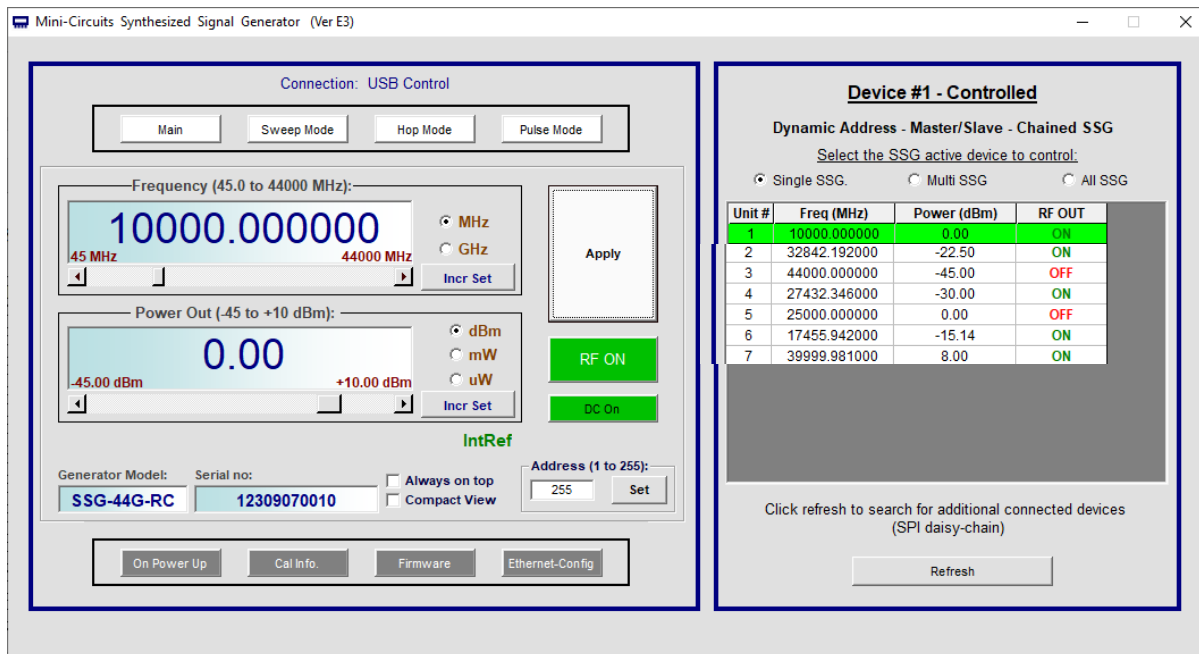

GRAPHICAL USER INTERFACE (GUI) FOR WINDOWS - KEY FEATURES

- Connect via USB or Ethernet
- Password protected access for safe remote usage over Ethernet

- Configure output power, frequency, pulse modulation
- Program timed signal output sequences (linear sweep and frequency hop)
- Control timed sequences in multiple generators simultaneously
- Track unit operation time since last calibration and setup calibration reminders

AUTOMATED SWEEP / HOP SEQUENCES

- Sweep across a frequency band at a fixed output power.
- Sweep output power levels at a fixed frequency.
- Hop through a list of pre-defined frequency / power settings.
- Set dwell times down to 10 μs in high speed mode.
- Run on demand or in response to external triggers.
- Produce triggers to signal switching points or completing a run.

DYNAMIC PULSE MODULATION

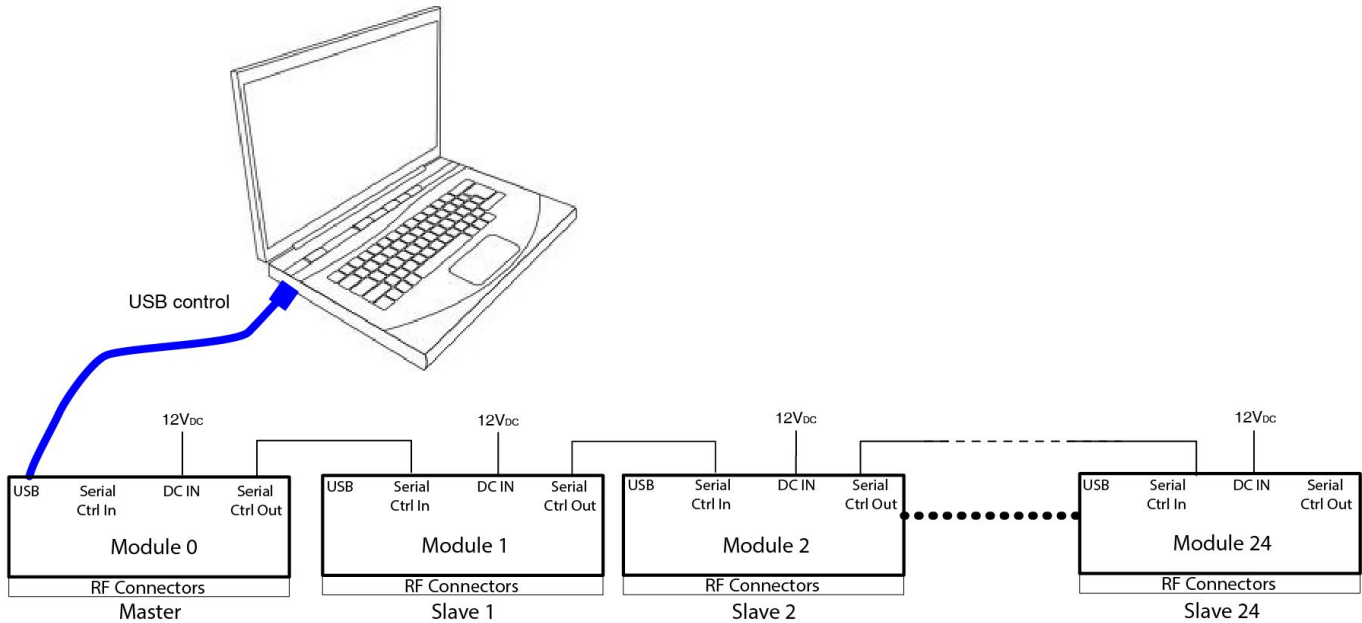

- Configure repetitive pulsed output sequences.
- Define custom pulse lists with a different frequency, power, width & interval at each step.
- Set pulse widths down to 0.5 us.
- Run continuously or for a preset number of cycles.

CONNECTING MULTIPLE MODULES (DAISY CHAIN)

The model is designed to connect up to 25 modules in series (daisy chain) using dynamic addressing, meaning there is no need to specifically set the address of the modules. The addresses will be set automatically as part of establishing the communications with the computer. The module connected to the computer's USB port or Ethernet connection will be assigned address 0 (master), the first module connected to it will get address 1 (slave) and subsequent modules incrementing up to address 24 (slave).

Connections between modules will be made using the serial in/out ports with the module connected to the PC act as a master and all other as slave modules. All control will be through the master module (address 0) which is the only one communicating with the PC or computer network. Serial control out port of each module should be connected to the serial control in port of the next module.

Power for the SSG-44G-RC must be supplied to each unit separately via their individual power supplies. The serial master/slave bus allows connecting modules of different types to the same daisy chain as long as all support Mini-Circuits Dynamic addressing setup. To add a new module to the setup, simply connect the module and refresh the address listing, no need to reset any of the existing modules or assign addresses manually.
