PRODUCT OVERVIEW

Mini-Circuits' ZTS series platform allows multiple solid-state switch types to be combined and integrated into a single rack-mount package with software control via USB and Ethernet. ZTS-1SP8T-852 is a solid-state SP8T switch operating from 10 MHz to 8.5 GHz with fast switching and high isolation.

The system is housed in a compact, 1U height, 19-inch rack chassis, with all RF connectors (SMA female) on the front panel and power and control connections out of the way on the rear panel.

The switch is controlled via USB or Ethernet (supporting SSH, HTTP & Telnet protocols). Full software support is provided, including our user-friendly GUI application for Windows, flexible API, and programming instructions for Windows and Linux environments.

The daisy-chain control interface further simplifies control integration by allowing multiple switch racks to be interconnected via their respective serial in and out connections. The complete set of daisy-chained switches can then be independently controlled through a single USB / Ethernet connection.

KEY FEATURES

Feature	Advantages
Solid-state switches	Fast switching and high isolation switch, well suited to automated test setups with large numbers of devices or channels under test
Wide bandwidth	Operation from 10 MHz to 8.5 GHz incorporates most of the key commercial wireless mesh network applications, including WiFi 6E, 5G FR1 and Zigbee.
Rack-mount chassis	Compact, 1U height 19" rack-chassis minimizes the rack space required in crowded production test environments.
Secure Ethernet communication	Support for SSH (Secure Shell protocol) provides a means for secure communication over Ethernet networks with strict security policies. HTTP & Telnet communication via Ethernet are also supported.

1. Isolation measured between any pair of ports J1 to J8
2. Isolation measured between Com and any disconnected port. Example: Isolation for COM to J1 is the leakage measured at port J1 from a signal input at COM when the active switch path is set COM to J2.
3. Return loss into COM port in all states
4. Return loss into any of ports J1-J8 when connected to COM
5. Return loss into any of ports J1-J8 when internally terminated (disconnected from COM)
